Online Survey Analysis System

By Sanika Gorakhnath Kangane

Problem Statement ~

- Surveys are commonly used to collect feedback from users.

- Analyzing survey responses manually can be time-consuming.

- A system is needed to :
  > Collect survey ratings from users
  > Store responses efficiently
  > Analyze the data automatically

- The goal is to develop a C++ program that accepts ratings and calculates survey statistics.

Solution ~

- The solution is an Online Survey Analysis System developed in C++.

- Main features of the system :
  > Accepts ratings from 1 to 5
  > Stores survey responses in an array
  > Calculates the average rating
  > Displays the total number of responses
  > Uses a menu-driven interface for easy interaction

- This system allows users to quickly analyze survey feedback.

Program WorkFlow ~

- The system displays a menu with three options :
  > Submit Response
  > View Analysis
  > Exit

- When the user selects Submit Response :
  > The user enters a rating between 1 and 5
  > The rating is stored in an array
  > The response count increases

- When the user selects View Analysis :
  > The system calculates the average rating
  > Displays the total number of responses

- The program continues to run until the user selects Exit.

Conclusion ~

- The Online Survey Analysis System successfully collects and analyzes survey responses.
- The program demonstrates the use of arrays, loops, conditional statements, and user input in C++.
- It provides a simple way to calculate average ratings and response counts.
- The system can be further improved by adding graphical interfaces or database storage.
